

IHN ELISA KIT

BIO K 273/1 - BIO K 273/2

Infectious haematopoietic necrosis (IHN) is a viral disease caused by a rhabdovirus. It affects most salmonid species, especially the fry and young fish. Susceptible species include rainbow or steelhead trout (*Oncorhynchus mykiss*) and brown trout (*Salmo trutta*); Pacific salmon, including Chinook (*O. tshawytscha*), sockeye (*O. nerka*), chum (*O. keta*), masou (*O. masou*) and coho (*O. kisutch*); and Atlantic salmon (*Salmo salar*). The disease causes sometimes extremely high economic losses, whether in fresh water populations or seawater fisheries. The clinical disease generally occurs in water at temperatures between +8°C and +15°C. It is characterized by nervous system and digestive disorders: alternating apathy and spasmodic movements, darkening of the skin, pale gills and a distended abdomen. Enteritis is evidenced by long, whitish excrement. Autopsy reveals exophthalmos, ascites and haemorrhages in the muscle mass and viscera. The liver, kidney and spleen are pale. The mortality rates associated with the virus can be high. It is almost impossible to distinguish IHN from viral haemorrhagic septicaemia (VHS), another Salmonidae viral infection likewise caused by a rhabdovirus, on the basis of clinical evidence alone. A differential diagnosis obtained by laboratory investigation thus appears to be indispensable.

EIA Procedure

- 1- Microplate coated with monoclonal antibodies
- 2- Add samples and positive control.
Incubate 1 hour at 21°C +/- 3°C
Wash
- 3- Add conjugate.
Incubate 1 hour at 21°C +/- 3°C .
Wash
- 4- Add chromogen (TMB)
Wait 10 minutes.
Add stop solution.
Read at 450 nm

Reliable Results

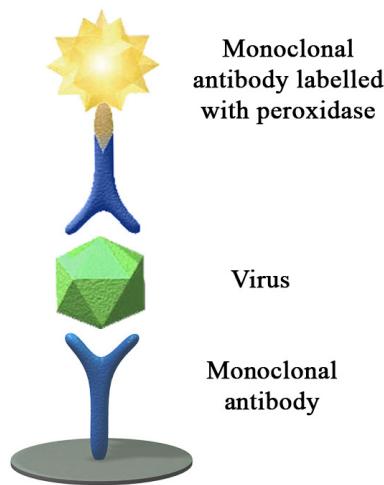

The use of monoclonal antibodies as conjugate and capture ensure excellent specificity and very reliable results.

Ease-of-Use

Minimal hands-on-time
Room temperature incubation
Results available in 140 minutes.

Flexibility

Results can be read visually or spectrophotometrically.

Example of results

IHN280	undiluted	2.732	Positive
Positive control		2.719	Valid

Conclusions

IHNV detectability between $10^{2,0}$ and $10^{5,5}$ / ml

No crossreactivity detected with other Rhabdoviruses.

The ELISA tests from Bio-X Diagnostics allow detection of IHNV after cell culture amplification.

Conclusions

The Bio-X IHNV ELISA kit detects all the tested IHNV isolates with correct results.

The specificity is 100 % by testing all VHSV positive in the IHNV test.

Composition of the kit

BIO-X IHNV ELISA KIT : BIO K 273

	BIO K 273/1	BIO K 273/2
Microplates	1 (48 tests)	2 (96 tests)
Washing solution	1 X 100 ml (20 X)	1 X 100 ml (20 X)
Conjugate	1 X 12 ml (1 X)	1 X 25 ml (1 X)
Positive control	1 X 2 ml (1 X)	1 X 4 ml (1 X)
Single component TMB	1 X 12 ml (1 X)	1 X 25 ml (1 X)
Stopping solution	1 X 6 ml (1 X)	1 X 12 ml (1 X)

Stability : One year between +2°C and +8°C
